17. Brief description of research work:

I have worked on few problems of statistical and condensed-matter physics. A brief description of my research work is given below:

- I have carried out some studies of the dynamic hysteretic response and nonequilibrium phase transition in the kinetic Ising model in the presence of a time-dependent (sinusoidally oscillating) field [59, 57]. These studies have involved Monte Carlo simulations and the numerical solution of the dynamical differential (mean-field, etc.) equations of motion [32, 47]. The athermal dynamic transition [49] in the random-field Ising model (2D) was studied by Monte Carlo simulations. The frequency variation of coercive field was studied [47] by Monte Carlo simulation and by solving dynamical mean-field equation. These studies constitute the major part of my earlier research work; they have been summarised in a review [41] which is published in **Reviews of Modern Physics, 71, (1999) 847**, ; and they include the following:
 - I have studied the nonequilibrium phase transition in and the temperature variations of AC susceptibilities, the 'relaxation' time and the 'specific-heat' [53, 51, 50] of the kinetic Ising model in the presence of a sinusoidally varying magnetic field.
 - I have investigated the behaviour of dynamic correlation function [44] near this transition and found an exact relation between the dynamic correlation function, the dynamic order parameter, and the hysteretic loss.
 - I have recently confirmed the existence of a tricritical point [42] by studying the temperature variations of the distribution of order parameter and the fourth-order cumulant.
 - I have elucidated the connection between this dynamic phase transition and the stochastic resonance in this system.
 - I have also studied this dynamic transition via dynamical symmetry breaking [45] in a randomly driven Ising ferromagnet.
 - I have investigated the dynamical response of kinetic Ising model to a pulsed magnetic field [52] and have proposed *finite-time* scaling in this context.
- I have carried out studies of both static [63] and dynamic properties [65] of granular materials (heaps of hard discs and spheres).
- I have studied [55] earthquake models (like the Burridge-Knopoff model) numerically and shown that, in these models, the *prediction* of imminent earthquakes is possible by measuring the response to periodic pulses.
- I have studied the dielectric breakdown problem [55] by solving Laplace's equation numerically on a lattice and have found a possible way of *predicting* the breakdown voltage prior to macroscopic breakdown. I have also studied cluster statistics and growth phenomena here.
- I have studied [48] the temperature dependence of the specific heat of a model that shows the Integer Quantum Hall effect by the numerical *diagonalization* of a tight-binding Hamiltonian.

- I have studied metastability and nucleation phenomena [46] in Ising systems by Monte Carlo simulations that use the multi-spin coding technique and parallel processing (*Geometric parallelization* on a CRAY-T3E). The applicability of classical nucleation theory to the analysis of our simulation results of the low-frequency hysteretic loss is discussed.
- I have studied [43] the effects of different boundary conditions on the spanning probability at the percolation threshold for random site percolation.
- The response of classical vector spin model (ferromagnetic) to time varying (polarized) magnetic field is current interest of research [38, 37, 35, 34]. The nonequilibrium multicritical behavior was found [33] in anisotropic Heisenberg ferromagnet driven by polarized magnetic field. A review [34] has been written collecting very recent works on the dynamic transitions in vector spin models.
- Studying the dynamical responses of model ferromagnets to the spatio-temporal variations of fields
(For video, <http://youtu.be/41TZPM-uxuc>
and http://youtu.be/S_rGUQNjcig).
- Studying the electronic properties[30, 27, 24] of solids in generalised d-dimensions.
- Studying the dynamical responses of metamagnets[26, 16] to the time varying magnetic field.
- Studying the dynamical responses of driven [15] random field Ising model.
